

Writing in Notty

John Doe · August 19, 2025

Every note should start with the following template:

```
#import "/_template/template.typ": template, tr, ln
#show: template(
  title:      [Title],
  date:       datetime(year: 2025, month: 08, day: 19, hour: 22, minute:
13, second: 29),
  tags:       (),
  identifier: "20250819T221329",
)

# the content
```

Technically, the tags field is optional, and the identifier field can be arbitrary instead of a date string. To link to other notes, use `#ln("notty:id") [text]`. To transclude other notes, use `#tr("notty:id", hide-metadata: true, open: true)`; the last two parameters are optional and values here are default values. `hide-metadata` means does not display metadata like date and author under the title, and `open` means show the content for the transcluded note when outputting to HTML. Currently, it is recommended to create hierarchy of notes only through transclusion.

1. Use Emacs denote package to write in Notty
